Delivering Cloud Excellence With Trust

CloudEdge Explained.

(For internal use only)

1. What is CloudEdge?

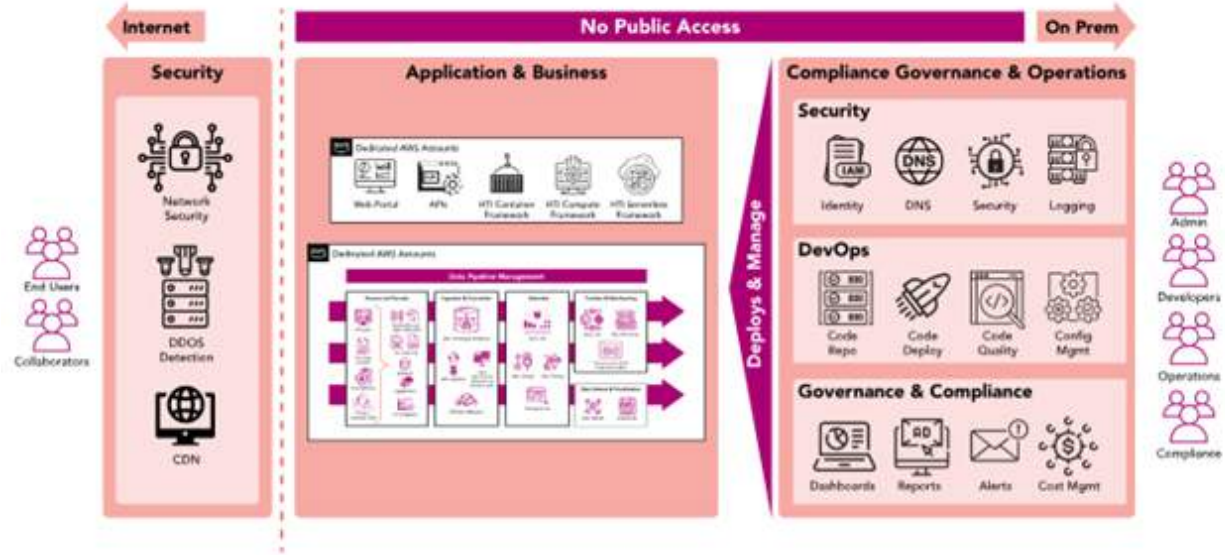

CloudEdge is a pre-built cloud infrastructure deployed within the SecureKloud's AWS/GCP/Azure cloud accounts.

Structurally, CloudEdge consists of two layers

Management Layer **Application Layer**

DevSecOps and Shared Services Components form the Management plane

- DevSecOps involves managing, updating, and deployments of various environments, along with networking, logging, compliance dashboards, firewall, IDS, IPS, SIM WAF, vulnerability assessments, IAM.
- Shared Services (Compliance + governance + operations) involves package management, configuration management, operating system security, DNS, encryption, backup and restore, IAC, CI/CD pipeline, infrastructure monitoring, OS hardening, certificate management, creation and hardening of cloud accounts
- The DevOps and Shared Services components are automated and common to all CloudEdge customers
- The application plane support containerized and serverless computing

2. Can the client choose to host their workloads within their AWS/Azure/GCP account?

Alternatively, customers can choose to host their workloads within their account. We call it cloud transformation services.

The infrastructure can be customized to their needs. Doesn't come in the same price point as CloudEdge and it will obviously be higher because of the customization involved. But there is flexibility for the customer because they can request for any changes in infrastructure.

On the other side, the customer cannot dictate infra changes if they were to adopt CloudEdge.

Either way, the customer is assured of a best-practices cloud infrastructure.

3. What core advantages does CloudEdge bring to the customers

- The infrastructure is complete with the security guardrails built-in.
- HITRUST certified
- Best practices architecture
- To achieve such an infrastructure, typically an organization could take 6-8 months. With CloudEdge, infrastructure is set up in hours.
- Accelerated time to market

4. What areas can we automate using CloudEdge?

For example:

- Can we automate containerizing an application?
- Can we convert a non-containerized application into a containerized one?
- Can we set up an entire CI/CD pipeline irrespective of where the codes are present?

When one provisions cloud infrastructure, there are usually a lot of steps involved in setting up the same. CloudEdge automates these steps of deployment through pre-written IaC that are battle-tested. These Infrastructure as codes ensures an automation at an infrastructure level.

CloudEdge does not concern itself with application-level automation.

CloudEdge cannot automatically convert a monolithic application into a containerized application. However, setting up of these containers is automated. CloudEdge comes with an automated CI/CD pipeline in place. So, customers can have their containerized applications deployed at the click of a button.

Any application-level tasks are outside the scope of CloudEdge.

However, SecureKloud Team can process service requests concerning applications. For instance, the team can help customers in modernization (convert a monolithic into a containerized application)

5. Why do we say our codes are battle-tested?

From our extensive experience working with larger organizations.
We have seen multiple use cases where:

1. Customers have migrated their existing cloud workloads from their cloud accounts to CloudEdge, or
2. They entered into the cloud afresh and start building applications in our infrastructure.
3. Some have onboarded and run their containerized and serverless applications.
4. A good majority have migrated from on-prem and have become cloud-ready in hours.

It is this vast experience that helped us templatize the codes that we have deployed in the past. These templatized codes help us spin replicas of best-practices based cloud infrastructure.

6. Will customers be able to access the infrastructure codes?

We don't give access to infrastructure as codes. The customer has access to only the application plane. If the infrastructure is set up within the customer account, they can access terraform or GitHub repository to view the lines of code. The GitHub repository is written in such a way that each line of code will have a readme file that explains the purpose, what is provisioned, etc.

7. What are the areas CloudEdge has "edge" over traditional setting up of the environment?

As answered earlier, the setting up of scalable, continuous compliant, secured, infrastructure is no mean feat. It will ideally take anywhere between 6-8 months to arrive at such an infrastructure.

What CloudEdge brings is this drastic discounting of effort (time and money) –

Where in one, your infrastructure is prebuilt, automated, compliant, secured.

On the other side, even if you were to face any challenges with respect to infrastructure – it will be taken care of either by code or team.

8. What is the cost incurred to the customer when they adopt CloudEdge?

Monthly cloud bills aside, CloudEdge incurs:

- A one-time onboarding fee of $50,000 (upto 4 applications)
- 24*7/16*5/8*5 support charges (if the customers wish to subscribe)

9. Who is CloudEdge' ideal customer?

The CloudEdge is most suited for organizations

- Who are yet to make a move to the cloud.
- Who have not cloud-matured meaning they might have ad-hoc cloud implementations but that is resulting in poor optimization; their infrastructure is not repeatable, systematic, quantitatively measured, and managed.

Some more observations related to CloudEdge and customer segments

- As of now, large enterprises might be hesitant to come to CloudEdge (switching their workloads to our cloud accounts) and hence they might take the transformation route (infrastructure set up within their cloud accounts)
- But the sales commentary should ideally start with exploring whether these large organizations are interested in hosting their workloads in CloudEdge and if they are hesitant, they could be asked to enable cloud transformation in their cloud account.
- Once CloudEdge has a marked presence with SMB organizations, then large organization seeing the results could eventually come to CloudEdge.
- Roche had a use case where they had to share their data with third party organizations. The data is not critical but there was an obligation to do data sharing in a secure, compliant manner. They chose our infrastructure.

10. How would you pitch CloudEdge to customers who are already in cloud?

As said earlier, CloudEdge is also suited for organizations who already have a presence in cloud.

What we have to observe here is how they currently utilize the cloud.

With CloudEdge – their cloud usage is

a) optimized, b) secured, c) compliant, d) automated.

These 4 levers are extremely compelling for organizations (already in cloud) to adopt CloudEdge.

11. How much time does it take to migrate workloads from customers' cloud account to CloudEdge.

The migration can be done in a matter of days if not hours.

12. Can CloudEdge correlate with AWS architected framework and give the customer a compliance report after setting up of the environment.

Yes, we can. CloudEdge is based on well-architected framework

13. Is CloudEdge compatible with Azure as much as it is with AWS?

Yeah, we can achieve the same level of compatibility as it is with AWS.

14. What are the certifications that CloudEdge currently complies to?

The entire architecture has been taken through a HITRUST certification, which involves rigorous assessment of the platform in 4 respects: tools, technology, people, process. HITRUST is one of the stringent regulatory requirements applicable mostly to healthcare and life sciences. But since HITRUST ranks highest in the order of certifications, CloudEdge can meet the demands of certifications specific to other industries.

15. Does CloudEdge offer dashboard views to check for cost and compliance?

Yes, the customers can use the compliance dashboards to view the health of the platform, what resources are running, what resources are compliant, and any irregularities can be flagged based on the baseline defined.
They can also see the cost associated with each of the resources running on the platform.

SECUREKLOUD

Delivering Cloud Excellence With Trust

SecureKloud is a cloud-native company with a comprehensive suite of platforms and services uniquely architected on strategic innovation to primarily solve challenges around cloud, data analytics, blockchain, and enterprise security, thereby driving digital transformation to enterprises worldwide.

For 14+ years, SecureKloud has led the way in delivering cloud excellence with unwavering security and trust. Singularly focused on powering digital transformation, our automated cloud platforms have helped 350+ global enterprises including Fortune 500 companies stay ahead of the growth curve and outlast their competitors.
